- 7. What contribution of IDS to the ITRF2004?**

Summary. The purpose of this working document is to provide background information for the discussion among IDS Analysis Centers. Several aspects of the products available for the ITRF2004 are proposed for discussion: the terrestrial reference frames are analysed in terms of drifts, seasonalities and spectrum of their translations and scales. Various approaches of scale discrepancies and station screening are mentioned. A more detailed analysis of the station behaviours is presented in parallel by K. Le Bail.

1. Products analyzed

The products analysed in the remaining of this report are weekly time series of terrestrial reference frames (TRF) provided by the following Analysis Centers.

- IGN-JPL (622 files)
- INASAN (610 files)
- LEGOS-CLS (615 files). Note: the 2002-2004 solution is still the unrevised one (18/04/05)
- GSFC (~52 files)

The series of TRFs were provided by the Analysis Centers under the form of series of unconstrained TRF-EOP solutions (Sinex files) at weekly intervals, covering the years 1993 through 2004, except for the GSFC solution, which covers the year 2004 only.

These are referred to ITRF2000 using the CATREF software at CLS. The CATREF analysis is restricted to the consideration of the station coordinates. The list of reference stations used to define the datum is given in section 5. The output of this treatment analysed here are as follows.

- Time series of translation and scale parameters
- Time series of station coordinate residuals

2. TRF origin

The translation of the origins of the TRFs are measured relative to the ITRF2000 origin, that is based on the most reliable SLR solutions. Their differences are listed in tables 2-4.

Table 2. Translation Tx: Bias, trend and annual component

Series	Bias	Linear trend	Amplitude of annual term	Residual StDev
ignwd05	3.3 mm	-0.53 +- 0.09 mm/year	5-10 mm	6.5 mm
inawd03	2.6 mm	-0.49 +- 0.08 mm/year	5-10 mm	6.4 mm
lcawd12	-5.6 mm	-0.81 +- 0.07 mm/year	5-15 mm	5.0 mm

Table 3. Translation TY: Bias, trend and annual component

Series	Bias	Linear trend	Amplitude of annual term	Residual StDev
ignwd05	7.3 mm	0.14 +- 0.09 mm/year	3- 8 mm	6.4 mm
inawd03	7.9 mm	0.18 +- 0.08 mm/year	3- 8 mm	6.6 mm
lcawd12	0.0 mm	-0.44 +- 0.07 mm/year	3- 6 mm	5.1 mm

Table 4. Translation TZ: Bias, trend and annual component

Series	Bias	Linear trend	Amplitude of annual term	Residual StDev
ignwd05	-35.3 mm	5.19 +- 0.42 mm/year	20-30 mm	31.4 mm
inawd03	-43.4 mm	5.19 +- 0.54 mm/year	20-50 mm	(1)
lcawd12	13.0 mm	0.46 +- 0.46 mm/year	15-30 mm	25.0 mm

Notes

- Evaluations unaffected by a -120 mm anomaly in 1998
- Not significant, because of the above-mentioned anomaly

The annual signatures of the translation parameters are shown on figure 1. The Tx seasonal components are large and changing in time after 1996, but in good agreement between the three solutions. For Ty, the amplitudes are smaller and more stable, with a semi-annual component appearing around 1998 in LCA. The Tz behaviour is similar to that of Tx, with quite larger amplitudes. The seasonal terms in Tx and Tz are in phase in all three solutions. The Ty and Tz LCA amplitudes are smaller than the others, with an interseasonal variation in Tz.

Figure 2 shows the same parameters over the 1992-1999 time span, for which estimations of geophysical-driven geocenter motion are available (Ramillien, Le Bail, Valette, Feissel-Vernier et al., article in preparation). All three DORIS Tx seasonal terms agree with it before they start changing amplitudes around 1996. In Ty, LCA is in best phase agreement with the geophysical expectation, with an discrepant semi-annual contribution appearing towards 1998. The amplitudes of the DORIS Tz are much larger than the geophysical expectation.

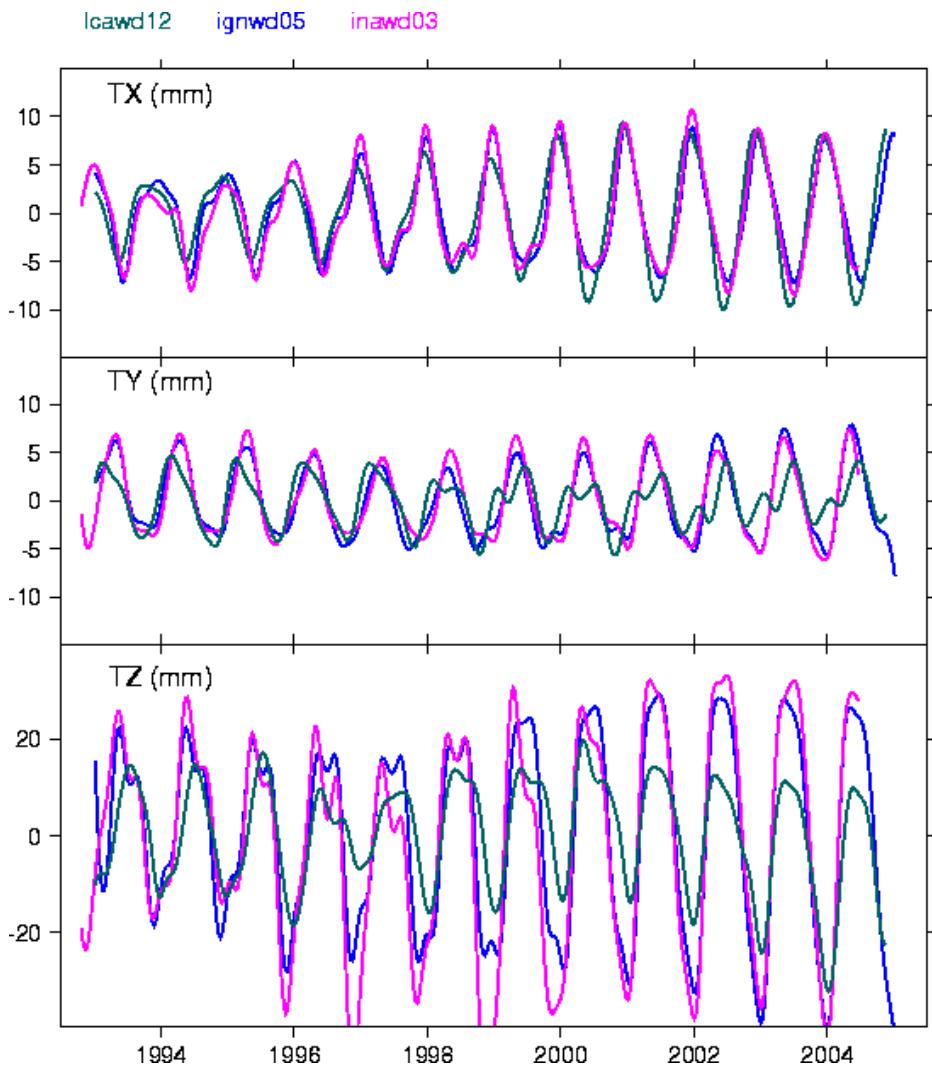

Figure 1. Annual component of TRF origin translations.
Colour code: blue: ignwd05; pink: inawd03; green: lcawd12.

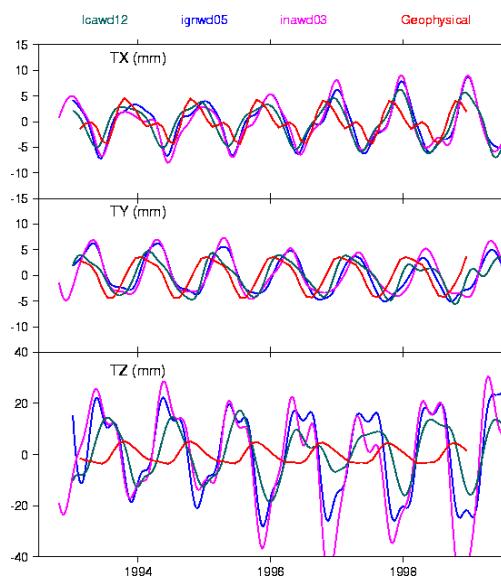

Figure 2. Annual component of TRF origin translations.
Colour code: blue: ignwd05; pink: inawd03;
green: lcawd02; red: geophysical.

Figure 3 shows the behaviour of the DORIS and geophysical TRF origin motions under a spectral viewpoint, using the Allan graph description. The three DORIS solutions have similar signatures in the equatorial plane components: the seasonal signature is imbedded in a noise with a spectrum close to white noise. The Tx and Ty components reach a stability of 2-3 mm for a one-year sampling time. The spectrum of the Tz variations is quite noisier than those in the equatorial plane, with a stability of 2-3 cm for a one-year sampling time. In all three components the spectral power of the DORIS signal remains higher than that of the geophysical one.

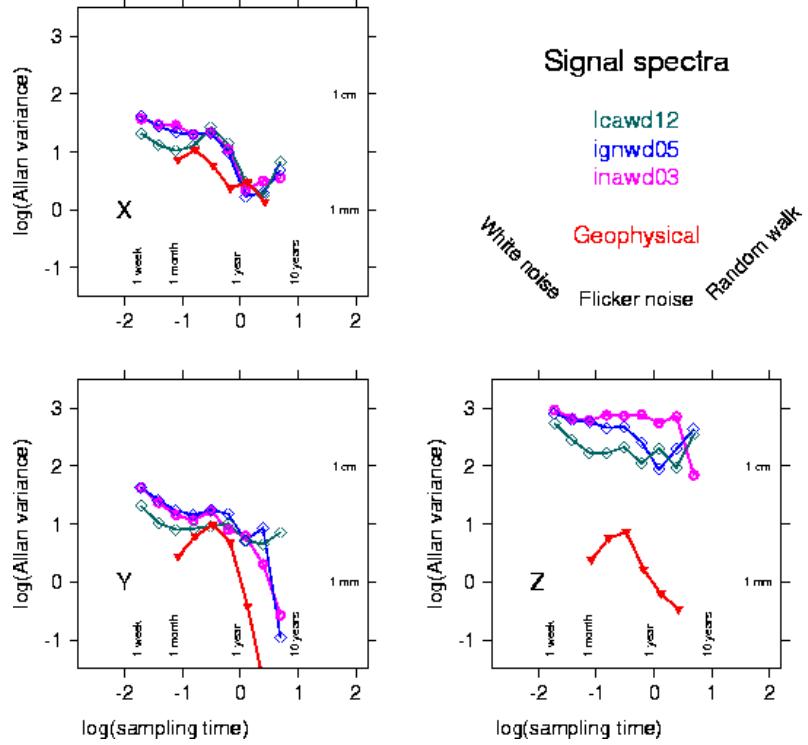

Figure 3. Spectral signature of geocenter motion observed with DORIS, SLR and expected from geophysical data. Colour code: blue: ignwd05; pink: inawd03; green: lcawd12; red: geophysical. A slope equal to -1 is the signature of white noise.

3. TRF Scale

The scales of the DORIS TRFs are compared with the ITRF2000 scale, that is based on the most reliable SLR and VLBI solutions. The differences are listed in table 5.

Table 5. TRF scale: Bias, trend and annual component

Series	Bias	Linear trend	Amplitude of annual term	Residual StDev
ignwd05	3.3 mm	-0.56 +- 0.09 mm /year	5-10 mm	6.5 mm
inawd03	-12.3 mm	-1.05 +- 0.06 mm /year	~5 mm	5.2 mm
lcawd12	40.7 mm	-0.32 +- 0.08 mm /year	~3 mm	4.6 mm

The annual signatures are shown on figure 4. Notice the changing with time of IGN amplitude and the phase opposition of the IGN and INA signatures. The LCA signal includes a sizeable semi-annual contribution and a low interseasonal component.

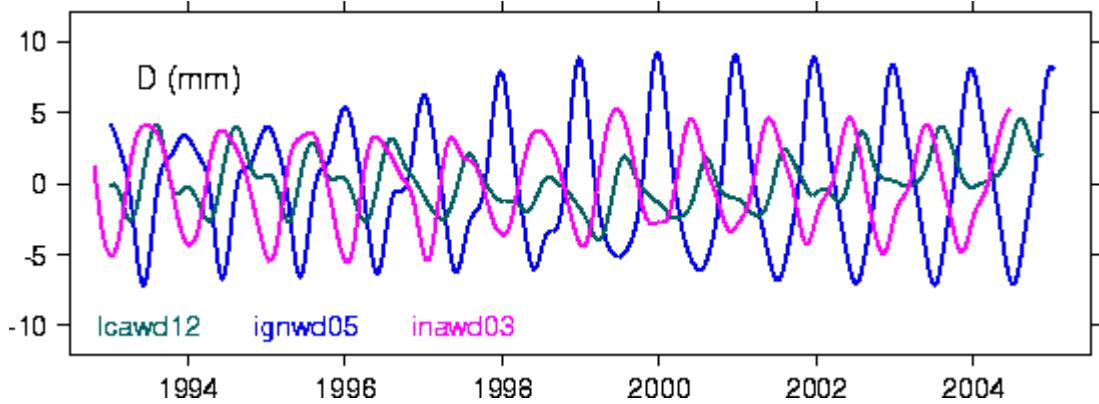

Figure 4. Annual component of TRF scales.
Colour code: blue: ignwd05; pink: inawd03; green: lcawd12

Figure 5 shows the behaviour of the TRF scale time series under a spectral viewpoint, using the Allan graph description. The IGN series has a higher level of noise in the short term, and the LCA a higher noise level in the long term. The annual component signatures are barely visible in the noise context. The scale reaches a stability of 2-3 mm (0.4 ppb) for a one-year sampling time.

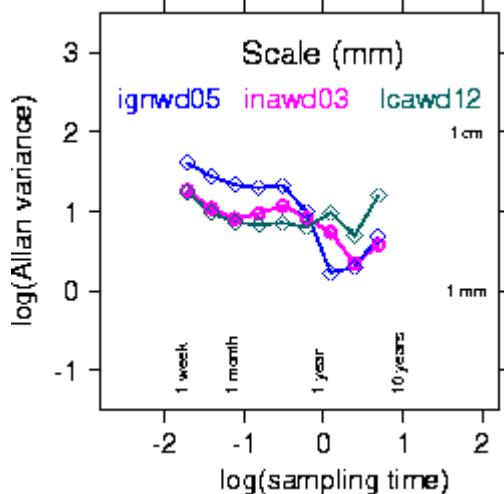

Figure 5. Spectral content of DORIS time series of TRF scale. Colour code: blue: ignwd05; pink: inawd03; green: lcawd12. A slope equal to -1 is the signature of white noise.

4. Station selections

The stations used for defining the datum in the CATREF analysis are listed in tables 6a (ign, ina, lca) and 6b (gsfc).

Table 6a. Datum stations for the the analysis of the ign, ina, lca series.

Willis & Ries have derived a core network for POD applications. The complete list is not yet available to us in machine readable form.

Le Bail & Feissel-Vernier have derived stability criteria based on the extra linear signal spectrum and the stability level for a one-year sampling time. See tables 10-12. More detail in K. Le Bail's presentation.

5. Station breaks

Table 7 gives the list of station breaks that were agreed upon in 2004.

Table 7. Datum stations for the the analysis of the gsfc series.

Additional comments by J. Ries follow.

- OTTA: Ottawa: several points have been defined for the same antenna using information contained in the DORISMail #0062 jan 4, 1999
- AMSA: all data have been deleted after Jan 1, 1996 (antenna fall)
- AMSB: Amsterdam all data have been deleted (antenna fall)
- SODA: All data have been deleted before Jan 1, 1996 (volcano depletion)
- Pascal has identified an additional break at TRIB on July 31 2004, due to an earthquake. Can that be confirmed by someone
- For COLA, the cause is an earthquake in our list. Can that be confirmed? It's nice to pin a real event to these when possible.
- Regarding AREA, we are dropping that as a break, in the sense that we now recommend no data after the quake be used. So there would be no break in the time series for AREA...it would just stop. There was too much non-linear motion after the quake for that data to be useable, even if a break is inserted
