

Overview of ESOC ITRF-2008 Processing

Michiel Otten ESA/ESOC

REFERENCE SYSTEM:

- polar motion and UT1: IERS bulletin A with IERS 2003 daily and sub-daily corrections
- stations coordinates: DPOD-2005 (v1.4) reference for Doris Stations, LPOD-2005 (v10) reference for SLR stations
- satellite reference: Post-Launch value of Mass, attitude model: Theoretical attitude model (yaw-steering)

FORCE MODELS:

- EIGEN-GRACE 05 gravity field up to degree/order 120 only C1 and S1 rates taken from IERS-2003 standards
- Atmospheric contribution to the gravity field up to degree/order 20 (AGRA 6-hourly files taken from GSFC service)
- IERS 2003 Solid Earth tides
- FES 2004 ocean tides (all principal constituents, with admittance) up to degree/order 50
- Sun, Moon, and all Planets (DE-405)
- ANGARA or plate model for drag, solar, infrared and albedo radiation
- MSIS-90 model for atmospheric density

SATELLITE PARAMETERS:

- 1-Day arcs, estimated Satellite State Vector
- Ten drag coefficients and one 1/rev along-track and cross-track constant per 24 hours for SPOT-X and Envisat.
- Four drag coefficients and one 1/rev along-track and cross-track constant per 24 hours for T/P and Jason-1/2
- Manoeuvres only for Envisat estimated other satellites excluded from the daily solution

TRACKING DATA:

- All station displaced corrections according to IERS 2003
- No atmospheric loading applied
- DORIS:
 - Troposphere: dry zenith calculated using GPT with Saastamoinen mapped with Dry GMF mapping function. Wet zenith delay estimated and mapped with wet GMF mapping function
 - Frequency: Bias per pass adjusted
 - Weight: 0.5 mm/s, 10 degrees elevation cut-off for all satellites, no down weighting applied to data

ESTIMATED ITRF PARAMETERS:

One day normal equation solutions are generated free of any constraints that include all the estimated parameters including the following ITRF parameters:

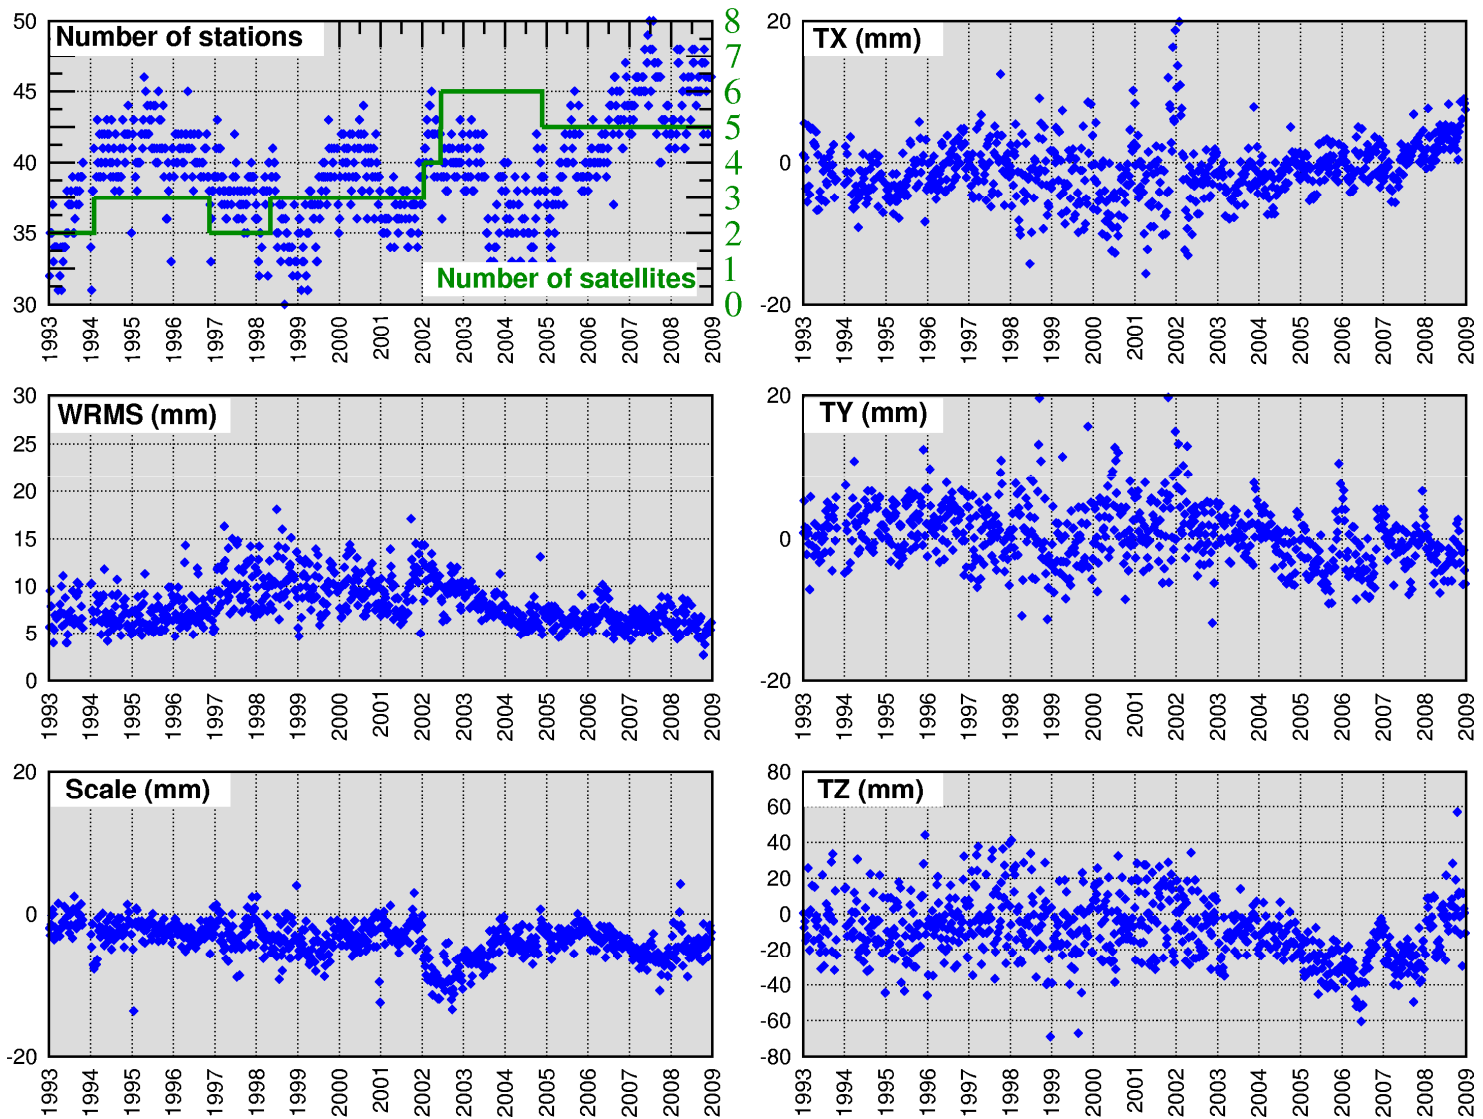

- Station coordinates
- One set of EOP values (offsets and rates)
- LOD

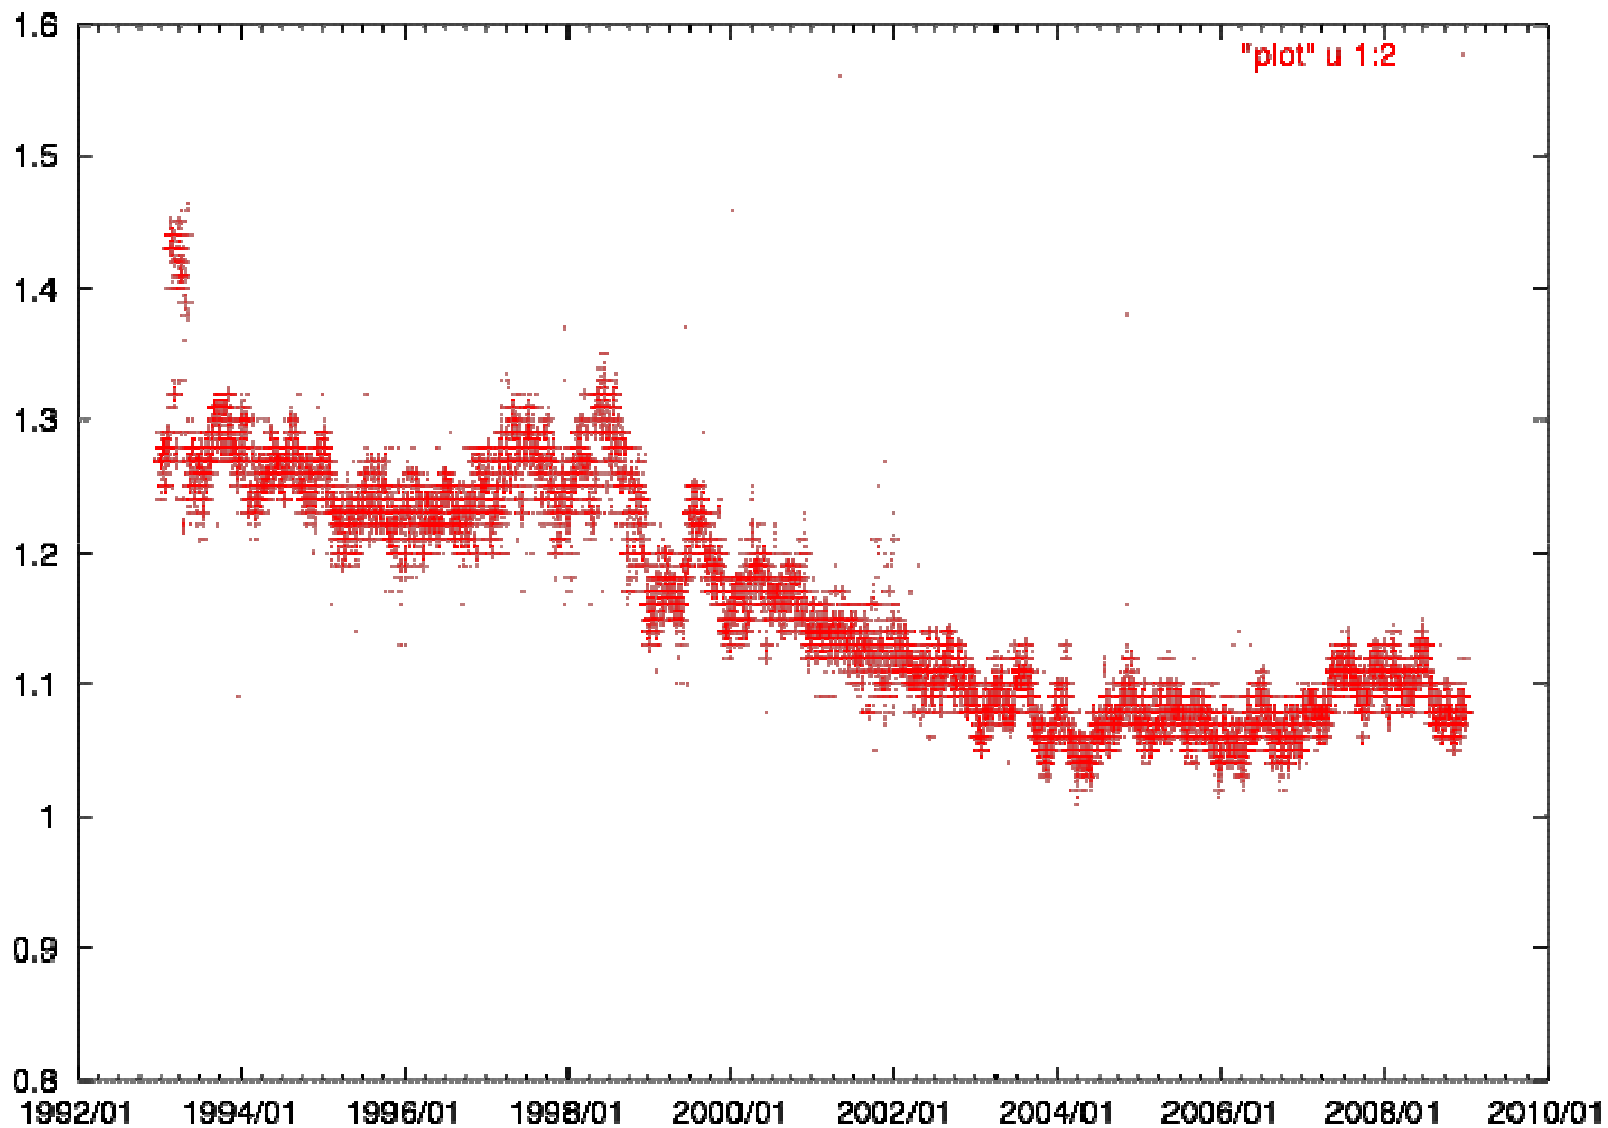

WEEKLY SINEX GENERATION:

- 7-Daily Solutions are stacked together on the normal equation level. From each daily solution the non-ITRF parameters are rigorously eliminated (for the satellite drag and CPR parameters constraints are applied when eliminating them).
- The resulting SINEX file contains thus the ITRF parameters free of any constraint.
- The daily normal equation files are saved and different elimination strategies can be used without having to regenerate the daily solutions.

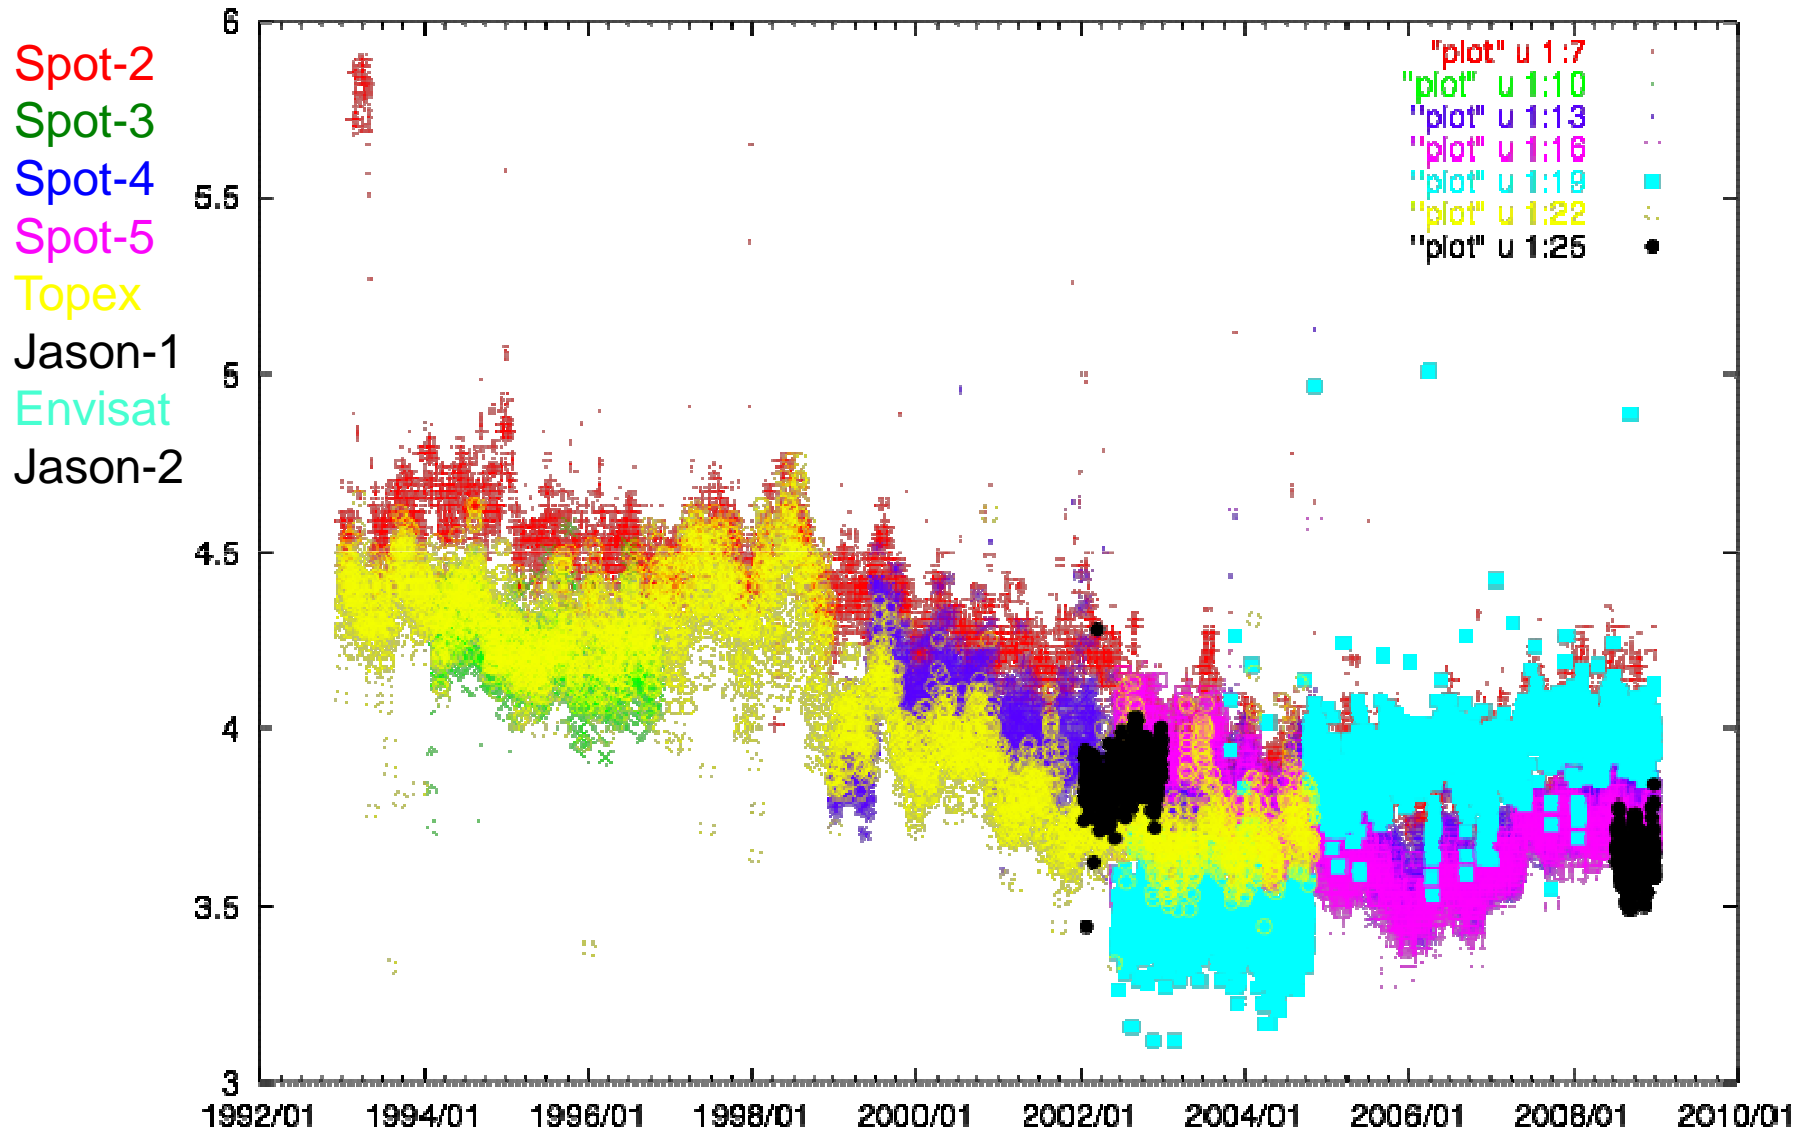

IDS-1 Weekly Comb. (Intr. constr. except for gau-gsc scale)
